

## **1    ABSTRACT OF THE DISCLOSURE**

2            A housing for a hand tool has a head, a handle and two positioning  
3    devices. The head is composed of two half casings each having a first adjusting  
4    base with a recess. The handle is pivotally attached to the head and is composed  
5    of two half casings each having a second adjusting base with a recess. The  
6    positioning devices are respectively mounted between the aligning recesses of  
7    the first and second adjusting bases on the head and the handle. Each positioning  
8    device has a pressing disk, a pressed disk and a biasing member. Each disk has a  
9    guiding block and a positioning block. The guiding block is formed on the disk  
10   and has two curved guiding edges selectively abutting against one end of the  
11   positioning block on the abutting disk. With such an arrangement, the housing  
12   can be adjusted between two positions easily and conveniently.
